METHOD OF DETECTING GENE MUTATION

5 ABSTRACT

DNA amplification and hybridization are successively carried out in a reaction

system containing primers for the DNA amplification and hybridization probes, followed by

detecting the hybrid in the reaction solution by affinity chromatography, wherein at least one

of the primers to be used in the DNA amplification is labeled with a first labeling agent so

that the amplified DNA will be labeled with the first labeling agent, a hybridization probe is

labeled with a second labeling agent and contained in a reaction solution for effecting the

DNA amplification, the base sequence of the hybridization probe is designed not to inhibit

the DNA amplification, and a hybrid is detected by affinity chromatography with the use of

the first and second labeling agents.
